ENERGY STAR Update

Tools for Tracking
GHG Emissions

RealPage Energy Summit
March 2, 2023

Agenda

- Extremely Brief GHG Emissions Overview
- Tracking in ENERGY STAR Portfolio Manager
- ENERGY STAR Building Emissions Calculator
- ENERGY STAR NextGen Preview

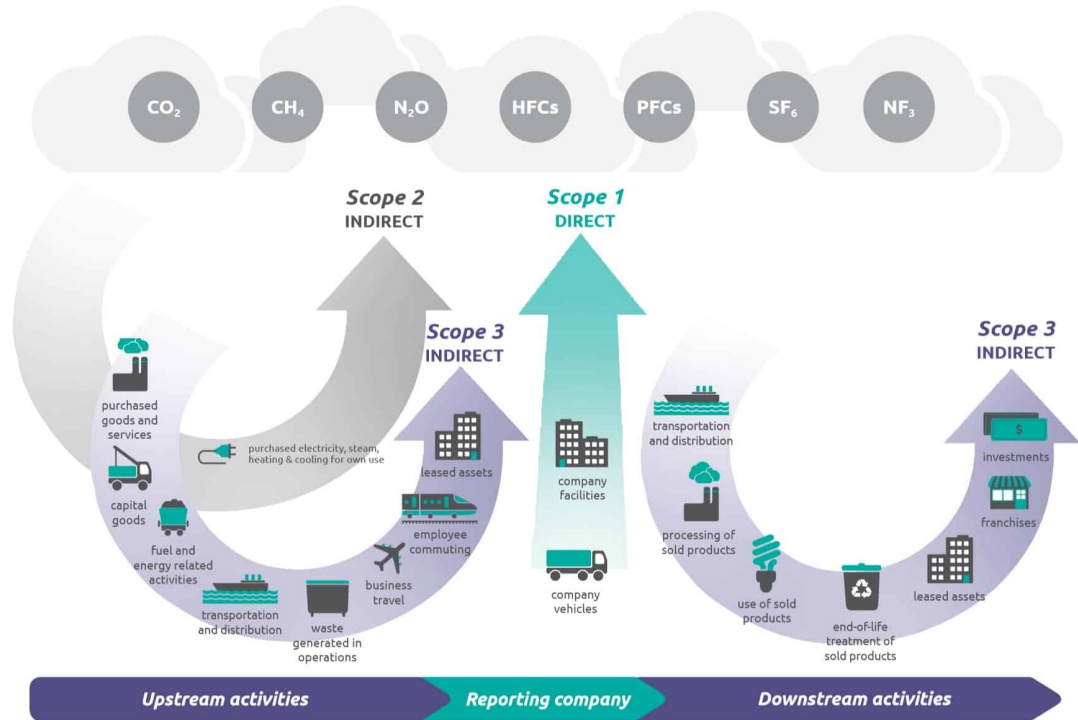

Overview of Scopes

Scope 1: Direct emissions from controlled activities
(e.g., owner-paid natural gas, fleet vehicles.)

Scope 2: Indirect emissions from controlled electricity consumption
(e.g., common area electric, parking lot lighting)

Scope 3: Indirect emissions from “induced” activities
(e.g., tenant-paid utilities, employee commuting, business travel, embodied carbon)

Source: [GHG Protocol](#)

Tracking GHG Emissions in ENERGY STAR Portfolio Manager

Portfolio Manager allows you to...

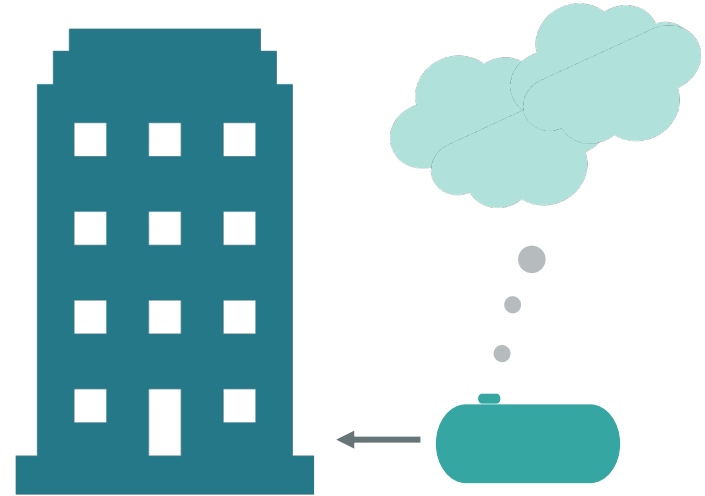

- Track the combined direct and indirect GHG Emissions of your properties
 - This includes assuming fuel-specific emissions factors for each primary energy product (direct), and regional emissions factors for indirect emissions from the power plant
- Track emissions benefits of on-site Green Power
 - Energy that is generated at your property via solar photovoltaic panels or wind turbines
- Track the purchase of Offsite Green Power from your local utility or third-party supplier
- Download GHG Emissions performance reports from the Reporting Tab

Please visit <https://energystar.gov/buildings/training> for trainings and webinars on GHG emissions tracking, reporting, and more!

Portfolio Manager GHG Inventory: Direct Emissions (Scope 1)

- **Direct emissions** result from the on-site use of primary energy products at a property, such as natural gas, fuel oil, or propane
- Portfolio Manager calculates direct emissions using a **default fuel analysis approach**, which assumes fuel-specific emissions factors for each primary energy product
- This approach only accounts for emissions at your building – any emissions from extracting or delivering these fuels are excluded

Portfolio Manager GHG Inventory: Indirect Emissions (Scope 2)

- **Indirect emissions** result from the purchase of energy delivered by a utility, such as electricity or district heat.
- In this case, emissions occur at the plant where the heat/electricity was originally produced.
- Indirect emissions include:
 - Electricity
 - District steam
 - District hot water
 - District chilled water

Summary of the Portfolio Manager GHG Inventory

Direct Emissions

(from the on-site use of primary energy products, such as propane, natural gas, or fuel oil, at a property)

Indirect Emissions

(from the purchase of a utility-supplied energy product such as electricity or other district fuels)

**Total
GHG Emissions**

Emissions Benefits from Onsite Green Power

- Portfolio Manager can track energy that is generated at your property via solar photovoltaic panels or wind turbines
- If RECs are retained:
 - You own the environmental claims to this energy, and it is considered Green Power
 - The energy you generate onsite and use onsite is counted as zero emissions in your inventory
 - PM will also calculate Avoided Emissions associated with this onsite Green Power
- If RECs are sold:
 - You no longer own the environmental claims to this energy, and it is no longer considered Green Power
 - The energy you generate onsite and use onsite is treated the same as grid electricity in your emissions inventory
 - No Avoided Emissions calculated

Emissions Benefits from Offsite Green Power

- Portfolio Manager allows you to track the purchase of Offsite Green Power (kWh + RECs) from your local utility or third-party supplier
- Portfolio Manager calculates the emissions benefit of Offsite Green Power as “Avoided Emissions,” based on the location where the accompanying RECs were generated

How does Green Power impact metrics?

Onsite

Site Energy – No effect

Source Energy – Decreases since renewables are more efficiently generated and used

Score – Increases since score is based on source EUI

Emissions – Decreases only if you maintain the RECs. If you sell them, electricity is treated as grid purchased

Offsite

Site Energy – No effect since you are using the same energy as always

Source Energy – No effect since the renewables aren't tied to the building

Score – No effect since source energy isn't affected by renewables

Emissions – Does not affect total emissions, but contributes to Avoided Emissions metric

Reporting and Goal Setting Features

Building Emissions Calculator (BEC)

The screenshot shows the Energy Star Portfolio Manager Building Emissions Calculator interface. At the top left is the Energy Star Portfolio Manager logo. At the top right is a 'Help' link. The main heading is 'Building Emissions Calculator'. Below the heading is a paragraph explaining the tool's purpose: 'This tool expands on Portfolio Manager's greenhouse gas (GHG) estimations functionality. Use it to estimate historical, current and future annual greenhouse gas emissions resulting from your building's energy use.' This is followed by another paragraph: 'Import your data directly from Portfolio Manager—or enter it manually—to see estimated GHG emissions from energy use at your building and portfolio, customize emissions factors, and forecast emissions scenarios.' A bolded warning states: 'Use the download function to export your data and results, as the Building Emissions Calculator does not save any information.' Below this is the instruction 'Click below to get started!' and three buttons: 'IMPORT DATA FROM PORTFOLIO MANAGER ACCOUNT' (with a document icon), 'UPLOAD REPORT FROM PORTFOLIO MANAGER' (with a document and upload arrow icon), and 'ENTER THE DATA MANUALLY' (with a hand pointing to a document icon). A small note below the third button reads 'Use this option if you don't have...'

Portfolio Manager®
Building Emissions Calculator

Help

Building Emissions Calculator

This tool expands on Portfolio Manager's greenhouse gas (GHG) estimations functionality. Use it to estimate historical, current and future annual greenhouse gas emissions resulting from your building's energy use.

Import your data directly from Portfolio Manager—or enter it manually—to see estimated GHG emissions from energy use at your building and portfolio, customize emissions factors, and forecast emissions scenarios.

Use the download function to export your data and results, as the Building Emissions Calculator does not save any information.

Click below to get started!

- IMPORT DATA FROM PORTFOLIO MANAGER ACCOUNT
- UPLOAD REPORT FROM PORTFOLIO MANAGER
- ENTER THE DATA MANUALLY
Use this option if you don't have...

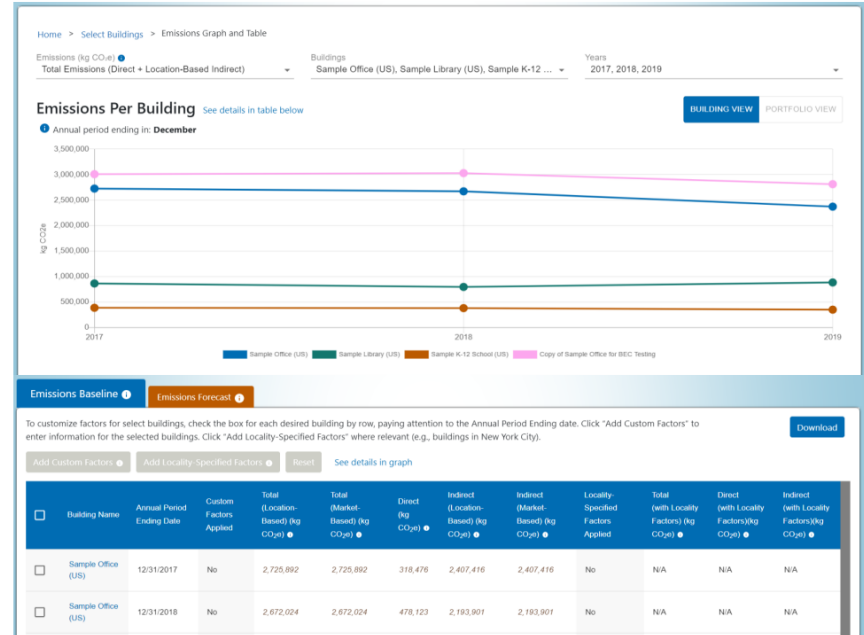

Features

- **Estimates Past, Current and Future Emissions**
 - Baseline annual emissions, track changes over time, and evaluate the impacts of anticipated changes in energy use, fuel mix, green power, and emissions factors.
- **Leverages Your Portfolio Manager Data**
- **Allows Entry of Multiple Emissions Factors**
 - National, regional, supplier-provider, or locality-specified factors, such as those required under New York City's building performance standard.
- **Complies with GHG Accounting Protocols**
- **Supports a Single Building or Entire Portfolios**

Calculator Interface

- View property or portfolio performance
- View baseline emissions, adjusted for market or locality-based factors
- Forecast emissions for one future year for each building
 - Adjust assumptions for anticipated future changes, such as reductions in energy use, % of green power etc.
- Save and download results in excel

Net-Zero Economy by 2050 Requires 3 Interdependent Pathways

Electricity Decarbonization

95% reduction in emissions intensity

Electricity Decarbonization

Energy Efficiency

40% reduction in per-capita final energy demand

Energy Efficiency

Electrification

300% increase in share of energy from electricity

Electrification

Evolved Energy Research: internal analysis (draft)

Objectives of NextGen Certification for Buildings

- Continue to encourage greater efficiency of commercial and multifamily buildings
- Recognize role buildings play in renewable energy investments
- Reward transition to efficient electrification
- Strive to keep it simple
- Leverage foundation of ENERGY STAR and Portfolio Manager

Proposed Criteria

Efficiency

ENERGY STAR certification

Renewable Energy

Procure 30% of energy
from renewable sources

Electrification

Meet target for onsite
GHG emissions

Energy Efficiency Criterion

Requirement: ENERGY STAR certification

Why?

- Ensures energy efficiency
- Well-understood and accepted
- Includes review of building data and verification
- Leverages existing ENERGY STAR infrastructure
- Can easily increase stringency over time

Consideration

- Restricts NextGen recognition to buildings eligible for ENERGY STAR certification

Renewable Energy Criterion

Requirement: 30% of total energy use from renewable sources

- Sources can include onsite renewable generation, renewable electricity certificates (RECs), renewable fuels, and/or renewable thermal certificates
- Total amount of RECs cannot exceed amount of electricity consumed
- Does not credit renewables that contribute to standard grid electricity

Why?

- Motivates buildings to procure renewable energy
- Does not penalize for lack of renewables on grid
- Single, national requirement keeps it simple

Consideration

- Does not account for low carbon grid
- Requires better tracking in Portfolio Manager

Electrification Criterion

Requirement: Direct (i.e., onsite) emissions limit

Why?

- Encourages progress toward efficient electrification and
- Recognizes fully electrified, efficient buildings

Consideration

- Fuels such as natural gas are predominantly used for space and water heating, so more is needed in cold climates for occupant comfort and safety
- Multifamily and other residential buildings need to use fuel throughout the day/have greater hot water and cooking needs
- EPA determined that normalization for climate/weather and building type is necessary

Normalizing Direct Emissions

- Heating Degree Days (HDD) measure the need for heating and are specific to a building's location
- EPA analyzed data from ENERGY STAR certified buildings (excluding 100% electric buildings) to determine the median direct GHGi per HDD for each type of building
- The medians are relatively consistent across regions
- These medians – or “GHGi Factors” -- can be used to normalize the NextGen Direct GHGi Targets

Proposed Factors for Calculating NextGen Direct GHGi Targets

Property Type	Proposed GHGi Factor (g CO ₂ e/ft ² /HDD)
Data Center	0.15
Retail Store	0.14
Warehouse	0.18
Office (incl. Office, Bank, Courthouse, Financial)	0.25
K-12 School	0.22
Worship Facility	0.25
Medical Office	0.24
Senior Living Community	0.46
Hotel	0.43
Multifamily Housing	0.29
Supermarket/Grocery Store	0.49
Hospital (General Medical & Surgical)	1.25

Determining if a Building Meets Electrification/Emissions Criterion

- Steps in Portfolio Manager:
 1. Calculate the building's unique NextGen Direct GHGi Target:
 2. GHGi Factor x Actual HDD over the past 12 months
 3. Compare the NextGen Direct GHGi Target to building's actual annualized direct GHGi
- If the building's actual direct GHGi is \leq its NextGen Direct GHGi Target, the building has met the requirement
- EPA will publish the GHGi Factors for each building type
- Portfolio Manager will show monthly progress toward NextGen Direct GHGi Target
- 100% electric buildings have zero direct GHG emissions and would always meet this criterion

Example NextGen Direct GHGi Target Calculations

	Office DC	Office NYC	Retail Store NYC	Retail Store Atlanta
NextGen Direct GHGi Factor (g CO2e/ft2/HDD)	0.25	0.25	0.14	0.14
Experienced Weather (actual HDD for prior 12 months)	3620	4147	4147	2682
Building's NextGen Direct GHGi Target (kg CO2e/ft ²)	0.91	1.04	0.58	0.38

Recap

- ENERGY STAR Portfolio Manager allows you to track and report on your GHG emissions (GHG inventory)
- Portfolio Manager uses a location-based approach, however the BEC allows you to assess and customize for a market-based approach
- Understanding emissions is 1/3 of the equation for a clean energy economy. Energy efficiency must still remain a priority, and investments in green power need to be made

Thank you!
